

## Abstract

The present invention relates to a run-in coating for gas turbines.

5

The run-in coating is used for sealing a radial gap between a housing (11) of the gas turbine and rotating rotor blades (10) of same, the run-in coating (13) being applied onto the housing (11).

10

According to the present invention, the run-in coating (13) is made of an intermetallic titanium-aluminum material. (Fig. 1)
